### Question:

Create a new SQLFiddle and then add the database from db.sql (provided in [tasks/1\\_introduction/day\\_2\\_basic\\_tooling/hands\\_on\\_sql](#)) to be able to perform queries.

Your task then is to do two things:

1. Insert two articles written by Joe ( `id` 3) into `articles` table (choosing the titles is up to you).
2. Write a query that will return you a list of articles written by authors who are at least 25 years old.

### Answer: (1)

```
1 INSERT INTO articles (author_id, title) VALUES
2 (3, 'How to become writer');
3 select * from articles;
```

### Output :

id	author_id	title
1	1	How to become famous
2	1	How to stop being famous
3	2	How to write interesting articles
4	3	Just a sample entry
5	3	Is it working though?
8	3	How to become writer

## Answer (2) :

```
6  
7 select articles.title, users.name from articles inner join users  
8 on articles.author_id = users.id where users.age >= 25;  
9
```

## Output :

title	name
How to become famous	John
How to stop being famous	John
Just a sample entry	Joe
Is it working though?	Joe
